

EasySpeak is an improved version of AAC software. It features a personalized agent based on information about the user that it has gathered from the user's previous conversations. This product will have a UI that is customizable based on the user's abilities. The team working on it are all Computer Science majors at BYU that are doing sandbox, a school sponsored incubator. Danny is the face of the project and has been helping with the design process along the way by asking questions and giving feedback.
